

Test of "BatteryLife Activator" the ex-OEM version of AkkuFresh® Next Generation™ by XtremeComputing

XtremeComputing was a prominent independent British online technology magazine and hardware review website that operated heavily throughout the 2000s and early 2010s. It was a well-known fixture in the PC enthusiast, overclocking, and hardware-modding communities, particularly in the United Kingdom and Europe.

The XtremeComputing successfully tested the product performance with the ex-OEM version of AkkuFresh® Next Generation™ in December 2004.

The XtremeComputing independent British online technology magazine and hardware review website has clearly proved the effectiveness of the original nano-tech battery life foil technology now called "AkkuFresh® Next Generation™"!

The "BatteryLife Activator" brand was originally produced in our factory between 2003 and 2005 and sold by BatteryLife AG. BatteryLife AG was co-founded by Aquis GmbH and Mark Korzilius in 2004. In 2004, the German company started to fake our original product. The fake products looked like the original product without the original performance.

In 2005, our manufactory revoked the distribution rights from the German company.

Since November 2006, AkkuFresh® Next Generation™ has been the only original product on the market.

The effect and performance of AkkuFresh® Next Generation™ depend on several factors: Type of device (mobile phone/notebook/camera / etc.), brand, model, type of battery, age, status (total amount of charging-discharging cycles), external temperature, environmental conditions, and cellular network.

BatteryLife Activator for Mobile phones and laptops

Today we have quite a strange review as this started out as a little news snippet about a product one of my PR contacts set me. I was as I said going to write a long news article about it, you know we have heard it before a sticker that extends batteries and never really work, but I was so impressed I had to write a review.

The Packaging

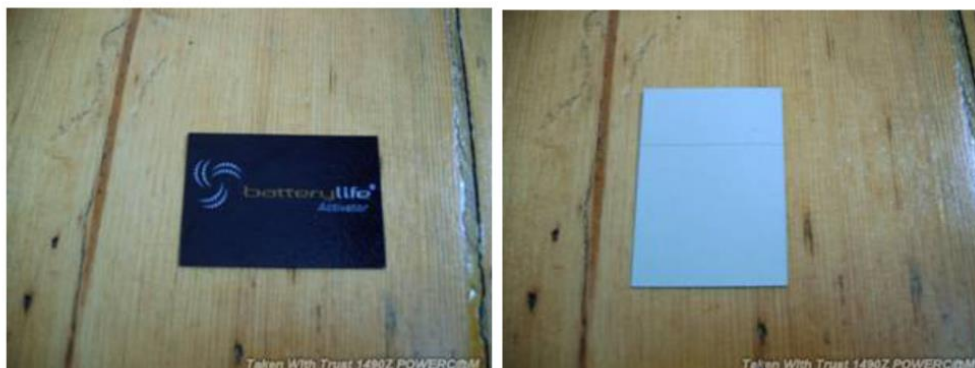

I received the package through the post and it was more or less what I expected. The package looked simple and was well made being stiff enough to ensure there was no bending, thus insuring that the batterylife activator arrives in perfect condition.

As you can see the contents of the package include an instruction booklet and the sticker itself. The booklet contained very specific instructions on the install of the sticker, with the emphasis on ensuring the sticker ends up facing away from you.

As you can see from the animated gif the procedure is quite easy and takes no longer than 1 minute to apply, before I let you in o the results let me show you the sticker in a bit more detail.

As you can see from the photos above its just like any over sticker except the coating, peeling the back of is simple and I had no difficulty affixing it. Now this is were things got more interesting after Attaching it to my p900 which was now a year old I decided to see how long the phone would last on standby. When I first got it used to last 2 days now it last a day and a half at most. So I am hoping the battery life activator would push it back to 2 days. While running this test I got a very interesting email form my pr sources, batterylife where making a Laptop version would I like to look at it so I agreed and they sent me a pre production sample to look at as well (I must stat the only thing pre production about the sample though was no packaging and that's it)

Wow that is one huge sticker and having seen a few laptops in my time it's a good job too, this way it covers all laptops as well as ensuring you have more than enough. With my laptop still holding a 1 hour charge I decided to pay a visit to the in-laws and use a 1+half year old laptop that only lasted 20 minutes on battery power.

As you can see there is plenty of sticker to cover the area and as the Sony Vio has a fairly large battery the sticker proved to be more than enough.

Now for what you are reading this for the results, I calculated these by running time tests on both this included idle use and load use (yes I am referencing to load on a phone but I mean phone usage) the batterylife's test involved sticking the stickers on waiting a few days and then looking for an improvement.

These are the amazing results I received.

Sony P900

Normal use (no calls or phone usage) 36.7 hours

Heavy use (used m3 player for this to constantly drain the battery) 6.3 hours

Normal use (same as above but with BatteryLife activator) 59.3 hours

Heavy use (same as above but with BatteryLife activator) 8.2 hours

Sony Vio Laptop

Normal use (just left on and no usage) 2.9 hours

Heavy use (Movie playback) 20 minutes

Normal use (same as above but with BatteryLife activator) 3.5 hours

Heavy use (same as above but with BatteryLife activator) 40 minutes

Part 4 - Conclusion

Wow I couldn't believe the result on the laptop with the batterylife activator getting a 100% improvement on the usage time going from 20 minutes to 40 under heavy load. The phone well the results speak for themselves, as I said I was a bit skeptical about this product as I have tried these sort of thing before but with this I was left well put it this way a changed person. No longer will I think that there is no way a sticker could do this type of job as the Activator has proved. Batterylife have obviously researched this product and I am glad to see it expand its product into the computer world with the laptop version, not only did it work it worked very well on the two products I tested it on and I highly recommend it.

Pros

- Easy to apply
- It actually works
- Cheap
- Well researched
- Available for your laptop soon

Cons

none
